*On the cover:* Insulinitis in a 13-year-old organ donor with type 1 diabetes for 5 years (nPOD 6243). Immune cell phenotypes in insulinitic islets were determined by multi-immunofluorescence. An insulinitic islet is shown with a lymphocytic infiltrate consisting of both CD3<sup>+</sup> T cells (pink) and CD20<sup>+</sup> B cells (green).  $\alpha$ -Cells are detected with antiglucagon antibodies (yellow). Their article, “Insulinitis and  $\beta$ -Cell Mass in the Natural History of Type 1 Diabetes” (p. 719) and an accompanying article, “Insulinitis Revisited” (p. 545), are featured in this issue of *Diabetes*.
